

Canna Seed

Nick the seed coat carefully with a nail file until the paler inner tissues are just visible, then soak the seeds in warm water for 12 hours. Sow the seeds in a good quality free draining compost and keep them in a warm, light position i.e. a propagator, at around 21 c (70 F)

Once big enough to handle, pot on, keeping them well watered and fed. Keep them in a warm and light area. Plant out when the danger of frost has passed.
